No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. Agents that stimulate or inhibit HICP protein activity or expression, antisense HICP nucleic acid molecules and HICP antibodies, can be used to modulate cell-associated activity. HICP modulators can be used to treat disorders characterized by abergant HICP protein activity or expression. Probes capable of hybridizing to HICP mRNA or antibodies specific for HICP can be used to detect HICP activity in a biological sample. HICP can be used to treat disorders, such as a cardiovascular or fibrotic disorder, characterized by aberrant cell proliferation. The present sequence represents the coding sequence of rat HICP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim

Agents that stimulate or inhibit HICP protein activity or expression, antisense HICP nucleic acid molecules and HICP antibodies, can be used to modulate cell-associated activity. HICP modulators can be used to treat disorders characterized by aberrant HICP protein activity or expression. Probes capable of hybridizing to HICP mRNA or antibodies specific for HICP can be used to detect HICP activity in a biological sample. HICP can be used to treat disorders, such as a cardiovascular or fibrotic can be used to treat disorders, such as a cardiovascular or fibrotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic

invention provides a rat heparin-induced CCN-like protein (HICP) telin. Agents that stimulate or inhibit HICP protein activity or ression, antisense HICP nucleic acid molecules and HICP antibodies, be used to modulate cell-associated activity. HICP modulators can be used to modulate characterized by aberrant HICP protein activity expression. Probes capable of hybridizing to HICP mRNA or antibodies cific for HICP can be used to detect HICP activity in a biological

                                                                                                                                                                        밁
                                                                                                                                                                                              Š
                                                                                                                                                                                                                                                                            The present invention describes Wnt-1 induced sected polypeptides, CC WISP-1, 2 and 3. The novel WISP polypeptides, designated WISP-1, WISP-2 CC and WISP-3 have homology to connective tissue growth factor (CTGP). CC Products from the present invention can be used to treat WISP-related CC disorders such as breast, ovarian, and colon cancer or melanoma. The CC used to treat other diseases e.g. benign and malignant tumours, CC leukaemia and lymphoid malignancies, neuronal, glial, astrocytal, and blastocoelic disorders, haematopolesis-related disorders, it issue-growth CC disorders, skin disorders, desmoplasia, fibrotic lesions, kidney CC disorders, bone-related disorders such as osteoporosis, trauma such as CC burns, incisions, and other wounds, connective tissue disorders, catabolic states, testicular-related disorders, and inflammatory, CC angiogenic and immunologic disorders including argeriosclerosis. The CC consecutive can also be used for detection and diagnosis especially of CC individuals with neoplastic cell growth or proliferation. The products can be used in the production of transgenic or knock-out animals.

The present invention describes Wnt-1 induced secreted polypeptides, CC WISP-1, 2 and 3. The novel WISP polypeptides, designated WISP-1, WISP-2 and WISP-3 have homology to connective tissue growth factor (CTGF). CC Products from the present invention can be used to treat WISP-related CC disorders such as breast, ovarian, and colon cancer or melanoma. The CC products can be used to treat arteriosclerosis. The products can also be used to treat other diseases e.g. benign and malignant tumours, CC leukaemia and lymphoid malignancies, neuronal, glial, astrocytal, by the products can also be used to treat other diseases e.g. benign and malignant tumours, CC hypothalamic and other glandular, macrophagal, epithelial, stromal, and CD blastocoelic disorders, haematopoiesis-related disorders, kidney CC disorders, skin disorders, desmoplasia, fibrotic lesions, kidney CC disorders, bone-related disorders such as osteoporosis, trauma such as burns, incisions, and other wounds, connective tissue disorders, CC catabolic states, testicular-related disorders, and inflammatory, CC angiogenic and immunologic disorders including arteriosclerosis. The CC products can also be used for detection and diagnosis especially of CC individuals with neoplastic cell growth or proliferation. The products can be used in the production of transgenic or knock-out animals.

CC antibodies can be used to induce death in WISP-1, 2 or 3 overexpressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                   This sequence encodes the EGF-like homologue PRO261.
The invention relates to antibodies (Ab) that bind to any of the polypeptides (I) designated PRO187; PRO533; PRO214; PRO246; PRO246 or EBAF-2. The Ab, or other agents that inhibit expression and/or activity of (I) are used: (i) to inhibit growth of tumours; and (ii) as diagnostic/prognostic reagents for detection or quantification of (I) in cells or tissues, by standard immunoassays, wi overexpression being indicative of cancer. For therapeutic use, the Ab may be conjugated to a toxin, chemotherapeutic agent or radioisotope. Genes expressing (I), many of which are growth factor homologues, are overexpressed in some cases of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         25-NOV-1997;

PRO261 is a CC growth factor. The invention relates to isolated antibodies which bind to CC a polypeptide. The "PRO" polypeptides are encoded by genes which are over CC expressed in the genome of tumour cells. Vectors and host cells comprising the nucleic acid encoding the antibodies are used in the production of the antibodies. The antibodies are used for diagnosing a tumour in a mammal. The antibodies are used for inhibiting the growth of tumour cells and identifying compounds CC that inhibit a biological or immunological activity of and/or expression CC that inhibit a biological or immunological activity of and/or expression CC of a PRO187, PRO531, PRO534, PRO240, PRO211, PRO230, PRO261, PRO266 or PRO317 polypeptide. The antibody can be used in antibody dependent enzyme endiated prodrug therapy (ADEFT) by conjugating the antibody to a compound component of the antibodies can be fluorescently labelled and monitored by light concorsopy, flow cytometry or fluorimetry for diagnosis and prognosis of cumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC AAS21244-AAS21518 encode for novel human secretory and transmembrane CC PRO polypeptides. The PRO polypeptides are useful to detect other CPRO polypeptides, to link bloactive molecules to cells expressing CC PRO polypeptides, to modulate biological activities of cells expressing CC PRO polypeptides, and to detect the presence of mammalian lung, colon, CC breast, prostate, rectal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. CC some of the 275 sequences are also useful to stimulate the release of CC tumour necrosis factor-alpha (TMF-alpha) from human blood, the CC proliferation or differentiation of chondrocytes, the proliferation or CC gene expression in pericyte cells, the release of proteoglycans from CC artilage, the proliferation of inner ear utricular supporting cells or CC of T-lymphocytes, the release of a cycokine from peripheral blood CC monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by Skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide CC factor VIIA. The PRO polypeptides can be used in assays to identify CC molecules involved in binding interactions. The polynucleotides encoding CC propolypeptides can be used to generate probes, antisense RNA/DNA, CC transgenic or knock out animals and can be used in gene therapy.

           The present invention relates to PRO proteins and coding sequences. The present sequence is the coding sequence for one such PRO protein. It was found that the PRO genes are amplified in the genome of tumour cells. The gene amplification is expected to be associated with the overexpression of the gene product and contributes to tumourlyenesis. Therefore, antagonists of PRO proteins are useful for the treatment of benign or malignant tumours, leukaemias, lymphoid malignancies and other disorders such as neuronal, glial, astroytal, hypothalamic, glandular, altroytal, hypothalamic, glandular,
                                                                                                                                                                                                                    Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic;

CC The invention relates to novel human angiogenesis-associated proteins CC designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding CPRO proteins. The invention also relates to vectors and host cells. CC comprising a PRO nucleic acid, the recombinant production of a PRO CC protein, PRO antibodies specific for a PRO protein, fusion protein, and compounds which inhibit the expression of a PRO protein and CC compounds which inhibit the expression of a PRO protein and CC compounds which inhibit the expression of a PRO gene. The invention CC additionally encompasses methods of identifying modulators of PRO CC expression or activity; diagnosing a cardiovascular, endothelial or angiogenic disorder, or a susceptibility to such a disorder by detecting CC mutations in a PRO gene, or the expression level of a PRO gene within a CC particular tissue; treating a cardiovascular, endothelial or angiogenic CC disorder via the administration of a PRO protein, PRO nucleic acid, or CC PRO nucleic acid; and methods of inhibiting or stimulating endothelial or antagonist; a retroviral gene therapy vector comprising a CC disorder via the administration of a PRO-induced angiogenesis via the CC administration of a PRO proteins, or an agonist or antagonist thereof. CC agonists and PRO proteins, or an agonist or antagonist thereof. CC administration of a PRO proteins, antibodies against PRO proteins, PRO CC atheroselerosis, oscoporosis, mycardial infarction, hypertension, CC diabetic retinopathy, rheumatoid arthritis, Crohn's disease, Huntington's CC endometriosis, ulcers, wounds, cancer, Alzheimer's disease, Huntington's CC disease, or stroke. PRO proteins, as hybridisation probes to component production of PRO proteins, as hybridisation probes to component production of PRO proteins, to analyze cidentity to PRO proteins, to analyze creatic disorders, and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 08-MAR-1999

```

```
This nucleotide sequence codes for human connective tissue growth CC factor-3 (CTGF-3) protein (see AAWA7946), a novel member of the CG growth factor superfamily. It was discovered in a cDNA library CC derived from human osteoblasts. The gene has also been identified CC in cDNA libraries from ovary, testis, heart, lung, skeletal muscle, CC adrenal medulla, adrenal cortex, thymus, prostate, small intestine CC are vectors, host cells and recombinant methods for provided CC cross, host cells and recombinant methods for producing CC cross-3 polypeptides. CTGF-3 nucleic acid sequences or their CC tragments, e.g. primers or probes, can be used to diseases where CG-3 expression is enhanced, e.g. cancer, arthritis, CC decreased such as in osteoporosis. Disorders characterised by CC administering CTGF-3 polypeptides and anti-CTGF-3 can be treated by administering CTGF-3 polypeptides and anti-CTGF-3 antibodies,
                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC and WISP-3 have homology to connective tissue growth factor (CTGF).

CC Products from the present invention can be used to treat WISP-related CC disorders such as breast, ovarian, and colon cancer or melanoma. The CC products can be used to treat arteriosclerosis. The products can also be cused to treat other diseases e.g. benign and malignant tumours. CC leukaemia and lymphoid malignancies, neuronal, glial, astrocytal, cc hypothalamic and other glandular, macrophagal, epithelial, stromal, and CC blastocoelic disorders, haematopoissis-related disorders, tissue-growth CC disorders, skin disorders, desmoplasia, fibrotic lesions, kidney CC disorders, bone-related disorders such as osteoporosis, trauma such as:

CC catabolic states, testicular-related disorders, and inflammatory, CC anglogenic and immunologic disorders including arteriosclerosis. The products can also be used for detection and diagnosis especially of CC individuals with neoplastic cell growth or proliferation. The products can be used in the production of transgenic or knock-out animals.

The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a protease. The inhibitor agent inhibits the action of at least one specific adverse protein, i.e. a protease, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (PGF), fibroblast growth factor (FGF), connective tissue derived growth factor (TGF), keratinocyte-derived growth factor (KGF), transforming growth factor (BGF-beta), granulocyte macrophage colony stimulating factor (GM-CSF), epidermal growth factor (EGF), vascular endothelial growth factor (VEGF), and chrysalin. Inhibitors which are included in the

17 isolated nucleic acid molecules encoding human secreted proteins, r used to preventing, treating or ameliorating a medical condition .

Claim 1; Page 427-428; 482pp; English.

CC The invention provides novel human secreted proteins and polynucleotides concoding them. The secreted proteins can be expressed by standard concombinant methodology. The secreted proteins and polynucleotides are cused to prevent, treat or ameliorate a medical condition in e.g. humans, concombinant methodology. The secreted proteins and polynucleotides are cused to prevent, treat or ameliorate a medical condition. The antibodies to mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They can concombinate the condition of the condition of the condition of the proteins associated with the condition of the condition of
